

# DETAW: A New Model to Estimate Consumptive Water Demands in the Delta

(Based on Asilomar 2006 Presentation “DETAW: A SIMETAW-Based Model to Estimate Consumptive Water Demands in the Sacramento – San Joaquin Delta” by Tariq Kadir DWR, Richard Snyder UCD, and Morteza Orang DWR)

DSM2 Users Group Meeting

April 25, 2006

Tariq Kadir

DWR Modeling Support Branch

Hydrology and Operations Section

# Objectives

- Improve the estimation of  $ET_{aw}$  and Net Application for the Sacramento-San Joaquin River Delta
- Consistency between models using same data:  
CALSIM and DSM2

# Approach

- Use GIS to delineate basic computational units (subareas) that can be aggregated up to the Delta scale
- Use GIS-based surveys (1992-2000) and 1976 for land use patterns to subareas. For historical/projected levels use CU model Lowlands/Uplands totals to disaggregate to subareas
- Estimate daily  $ET_o$  rates spatially across the Delta (by subarea) using Hargreaves Samani Equation (temperature based) and correlate with Penman-Montieth Equation (CIMIS) for WY1922-2003
- Compute daily  $ET_c$  rates for 15 land-use categories (agricultural crops, urban, native vegetation, riparian vegetation, open water surface) including off-season and in-season, in each of 168 sub areas.

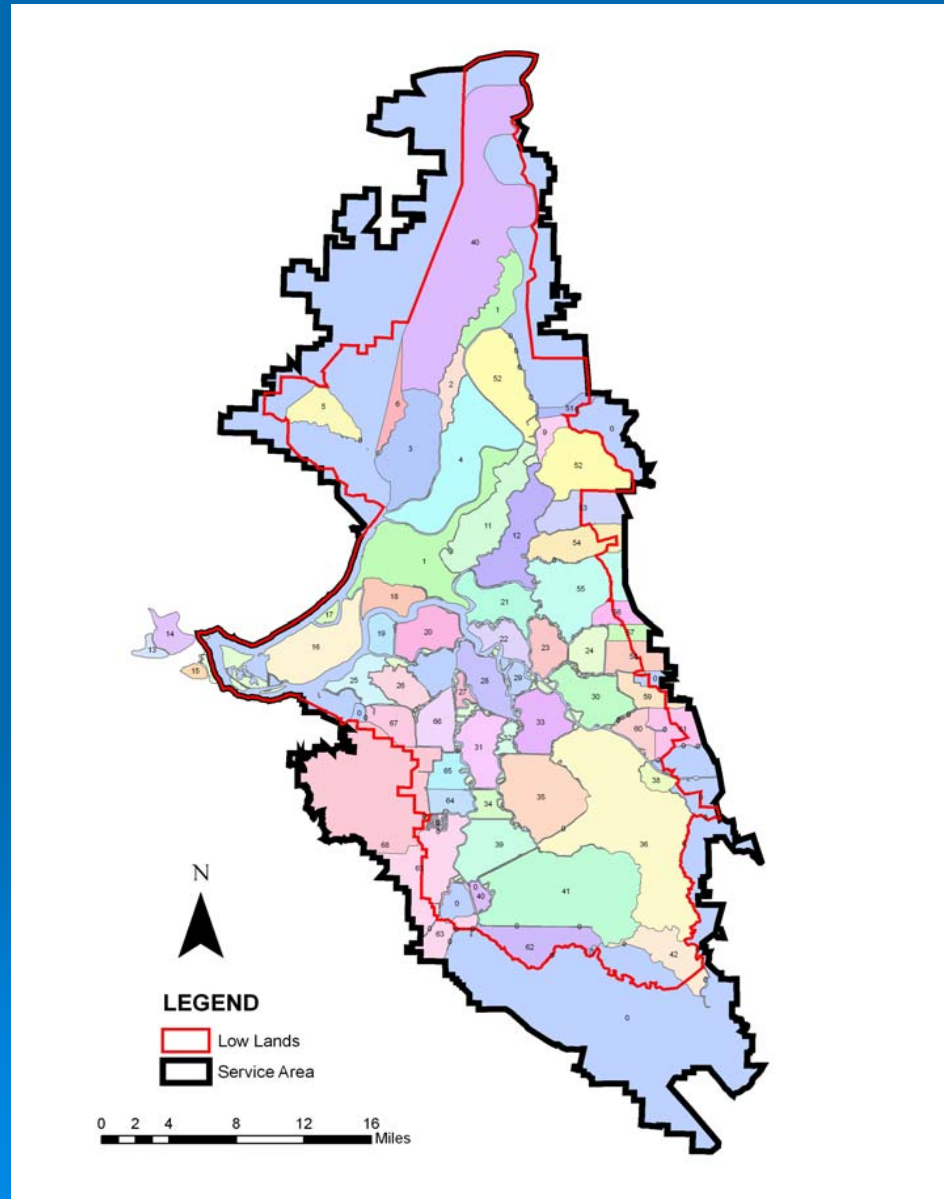

# Approach

(continued)

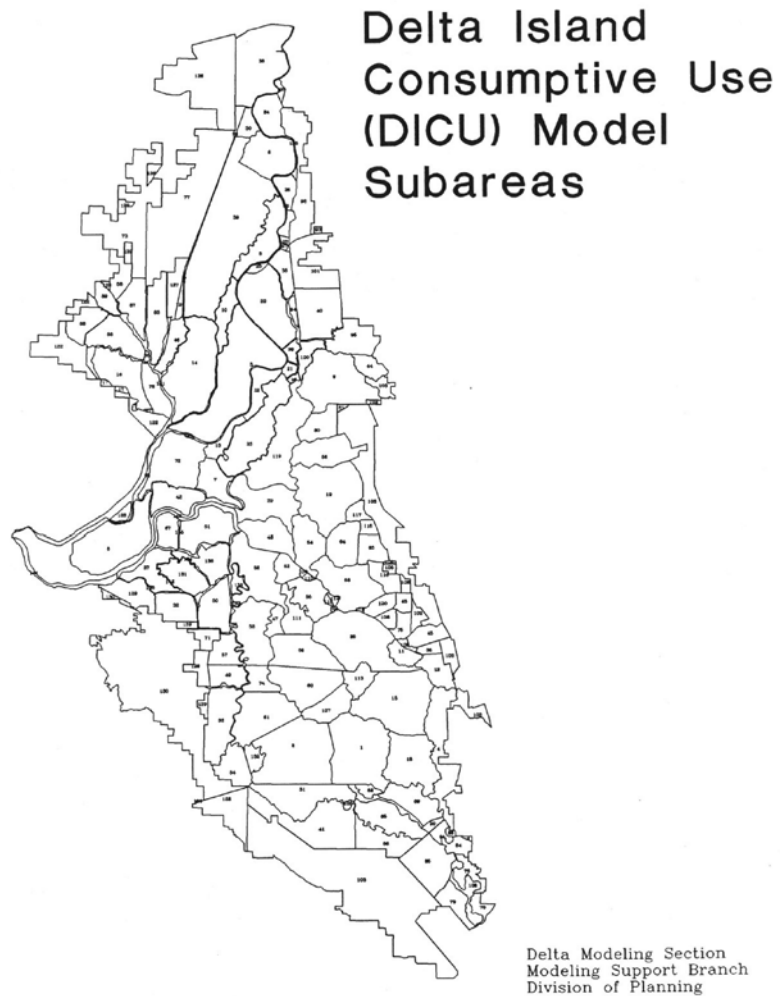

- Make daily soil water balance calculations to estimate seepage contributions, effective rainfall, net applications daily for 15 land surfaces in 168 Sub Areas of the Delta
- Estimate monthly, seasonal, and annual  $ET_{aw}$  for the Delta lowlands, uplands and the entire Delta

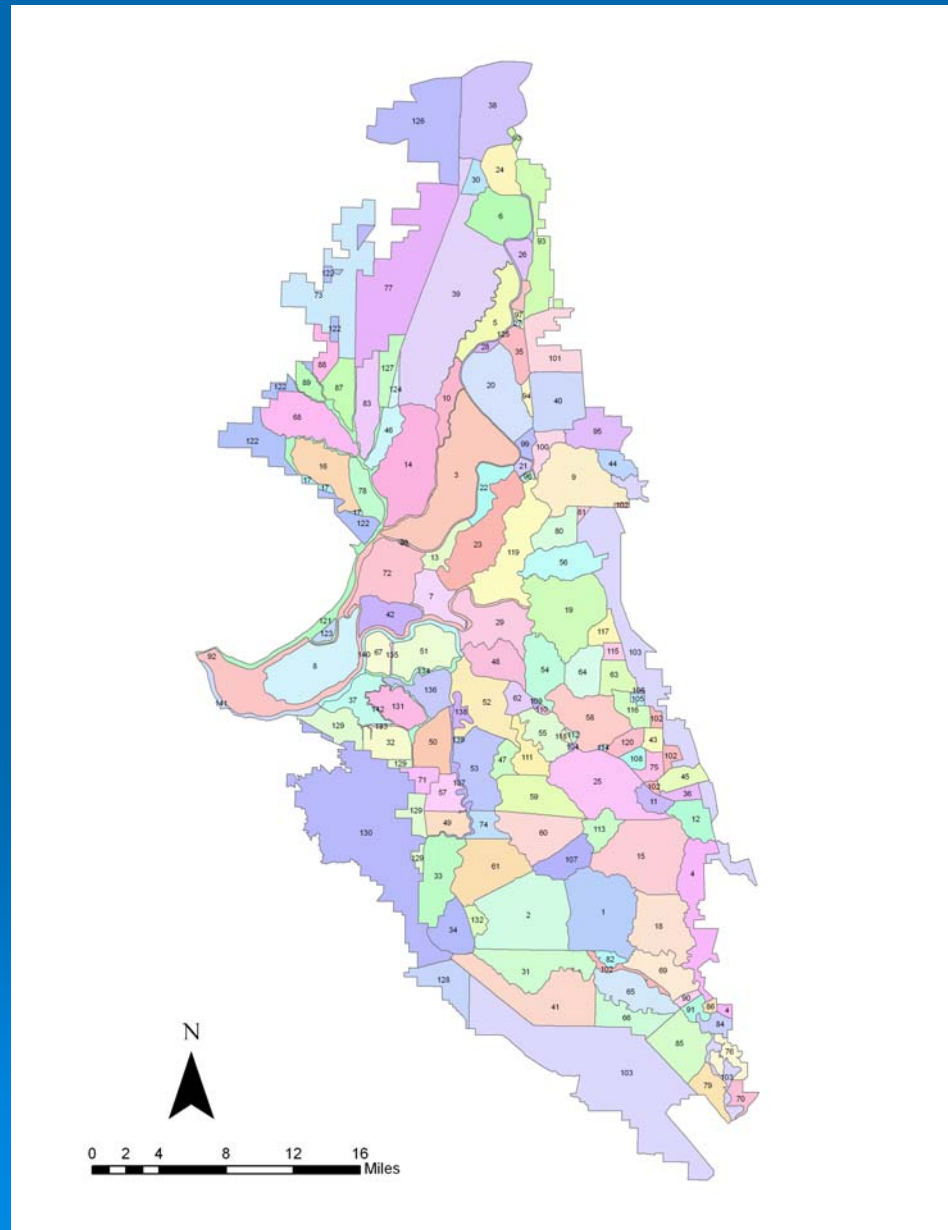

# GIS Delta Islands (DWR/DPLA)

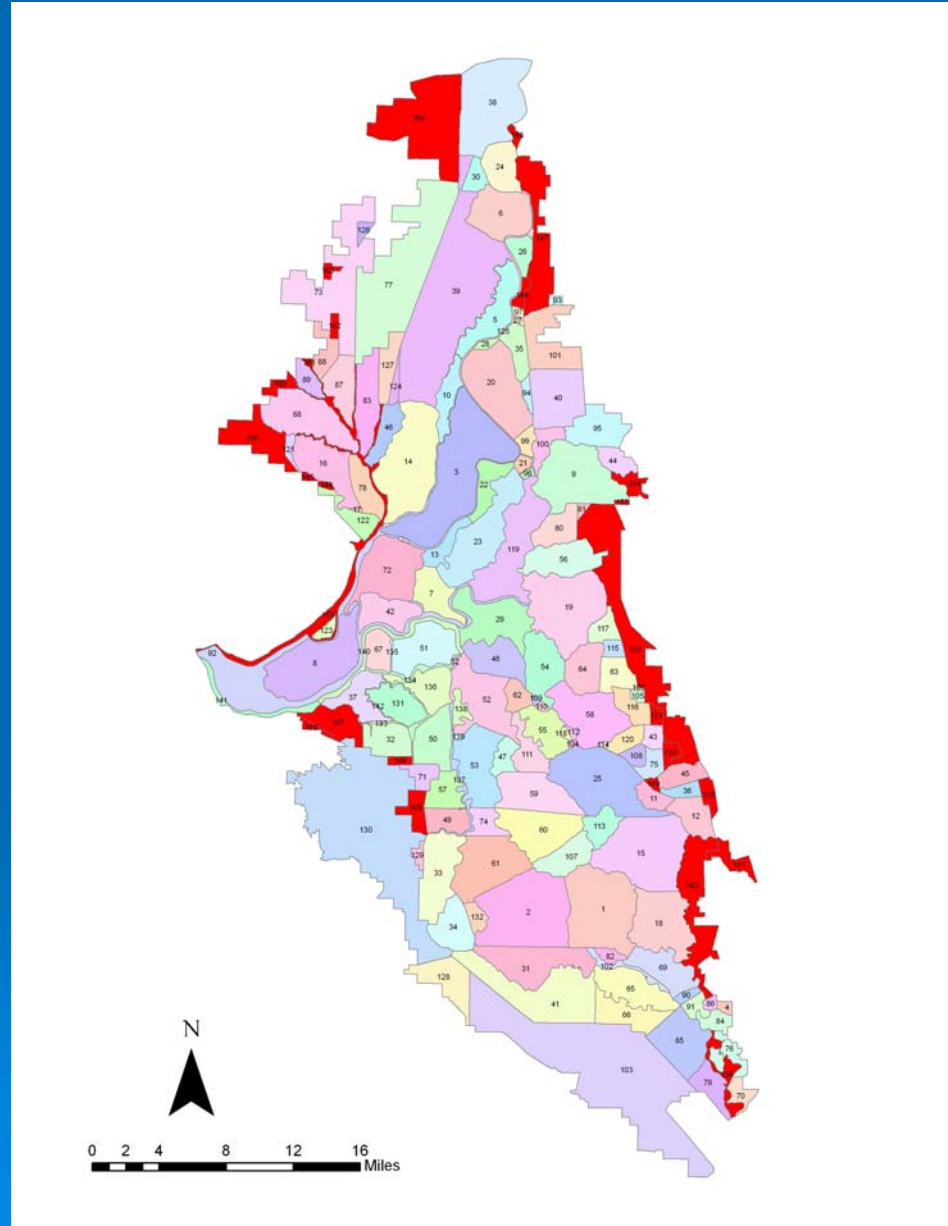

# Original 142 Subareas – Scanned Map

# 142 Subareas - Digitized

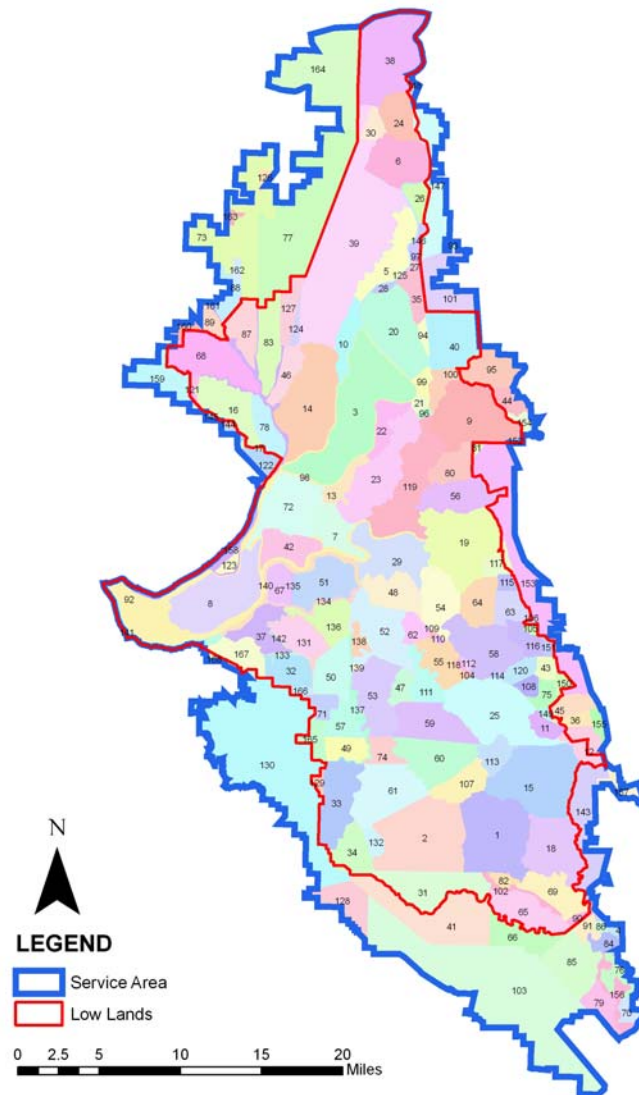

# 26 Newly Defined Subareas

# 168 Subareas

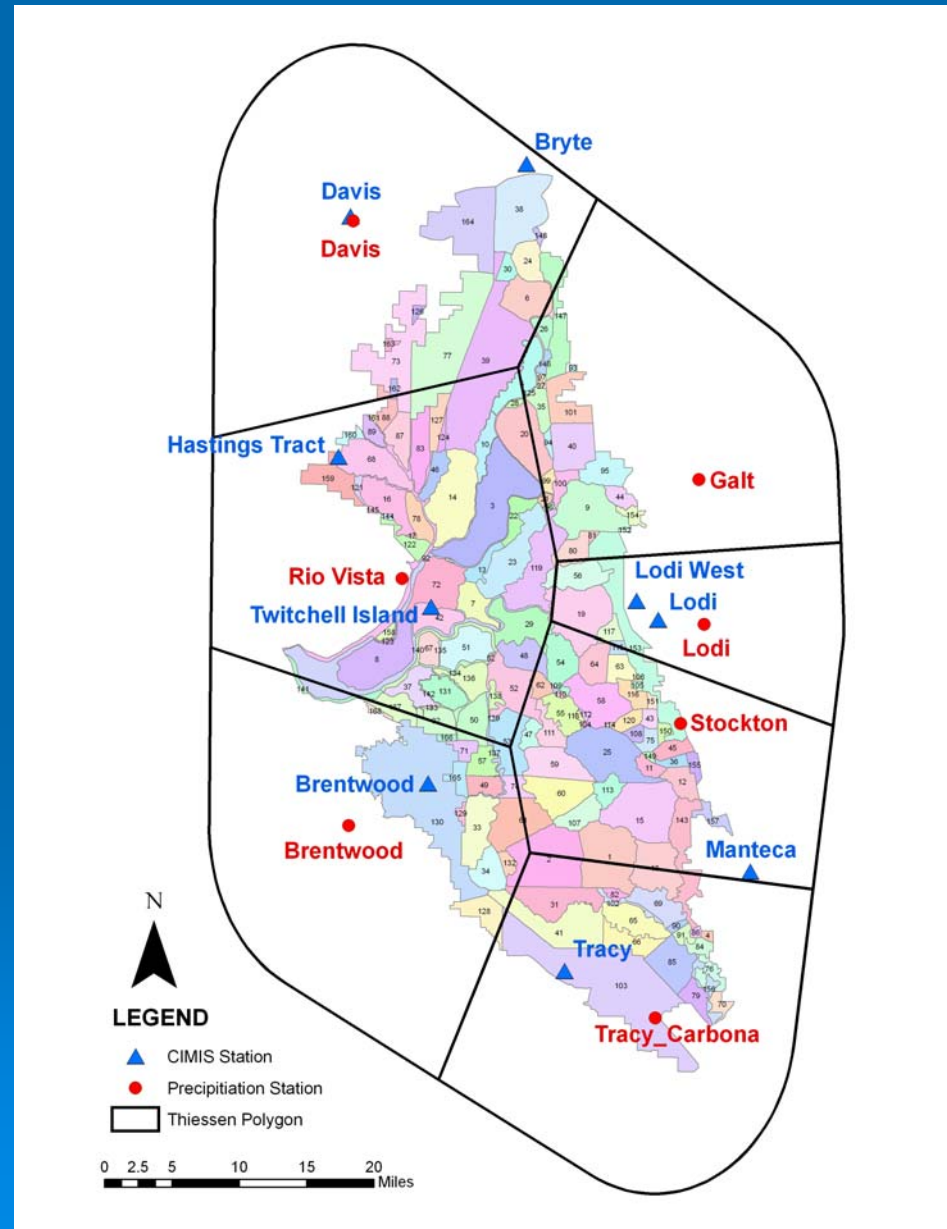

# 168 Subareas

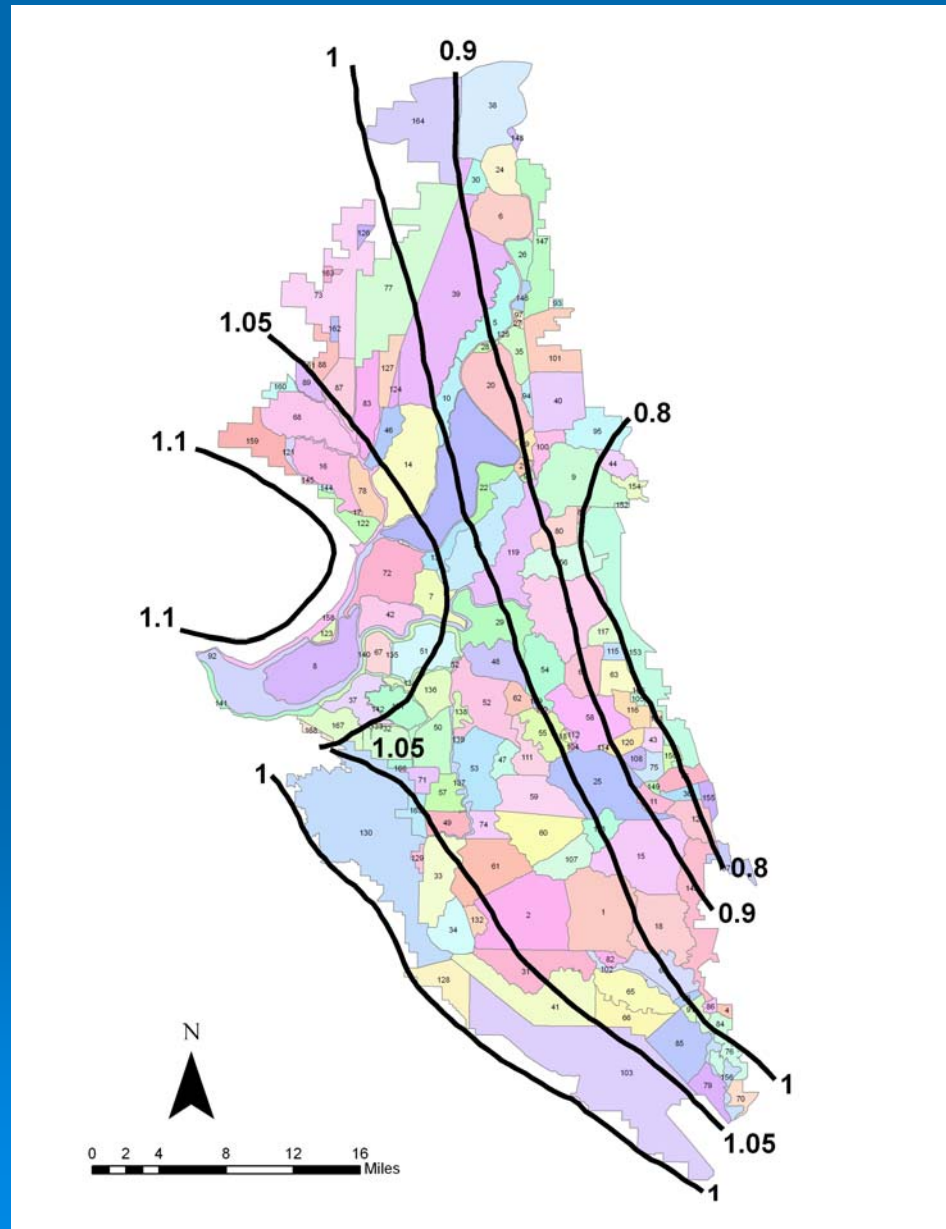

SUBAREA NAME	ORIGINAL SUBAREA	TEMP SUBAREA	NEW SUBAREA	REGION
UNION ISLAND (EAST)	1	1	1	Lowlands
UNION ISLAND (WEST)	2	2	2	Lowlands
GRAND ISLAND	3	3	3	Lowlands
MOSSDALE	4	4A	4	Uplands
MERRITT ISLAND	5	5	5	Lowlands
LISBON DISTRICT	6	6	6	Lowlands
ANDRUS ISLAND (LOWER)	7	7	7	Lowlands
SHERMAN ISLAND	8	8	8	Lowlands
SUTTER ISLAND	10	10	10	Lowlands

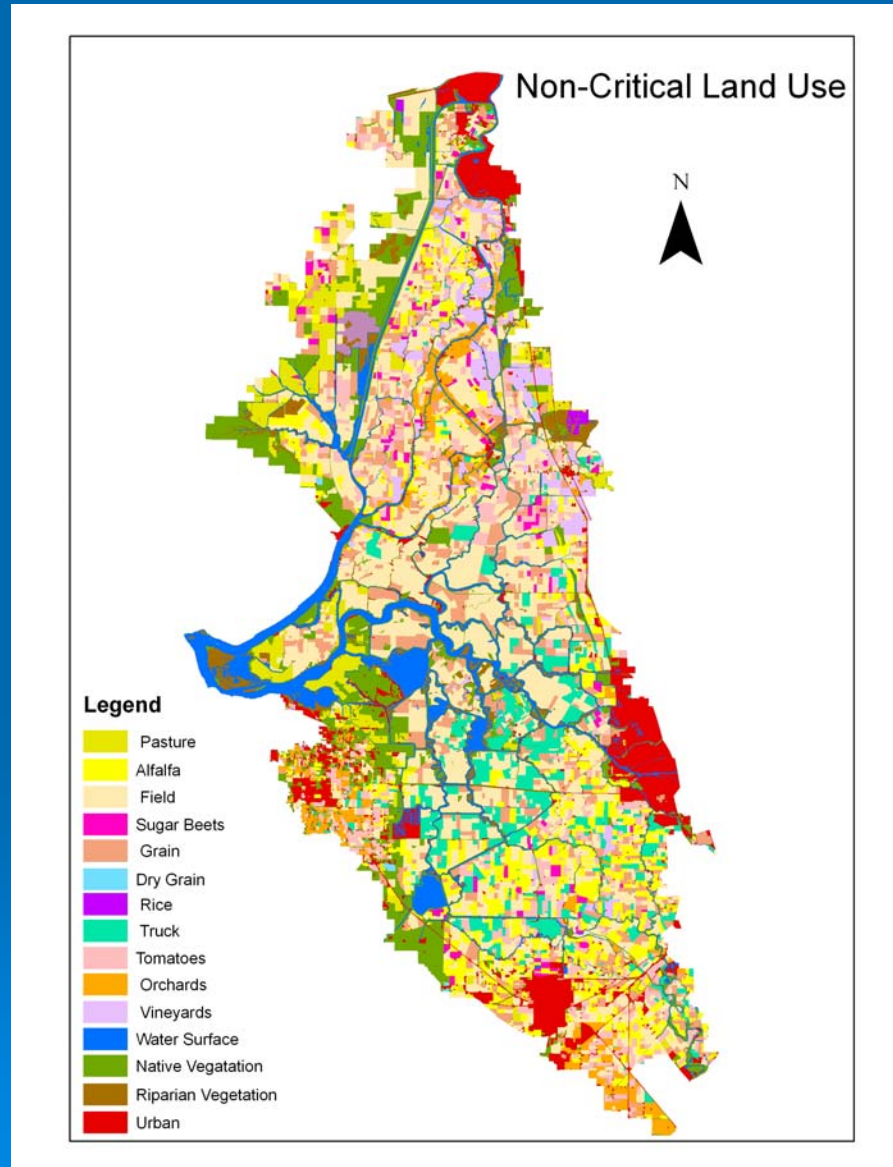

# Thiessen Polygons, CIMIS & Precip Stations

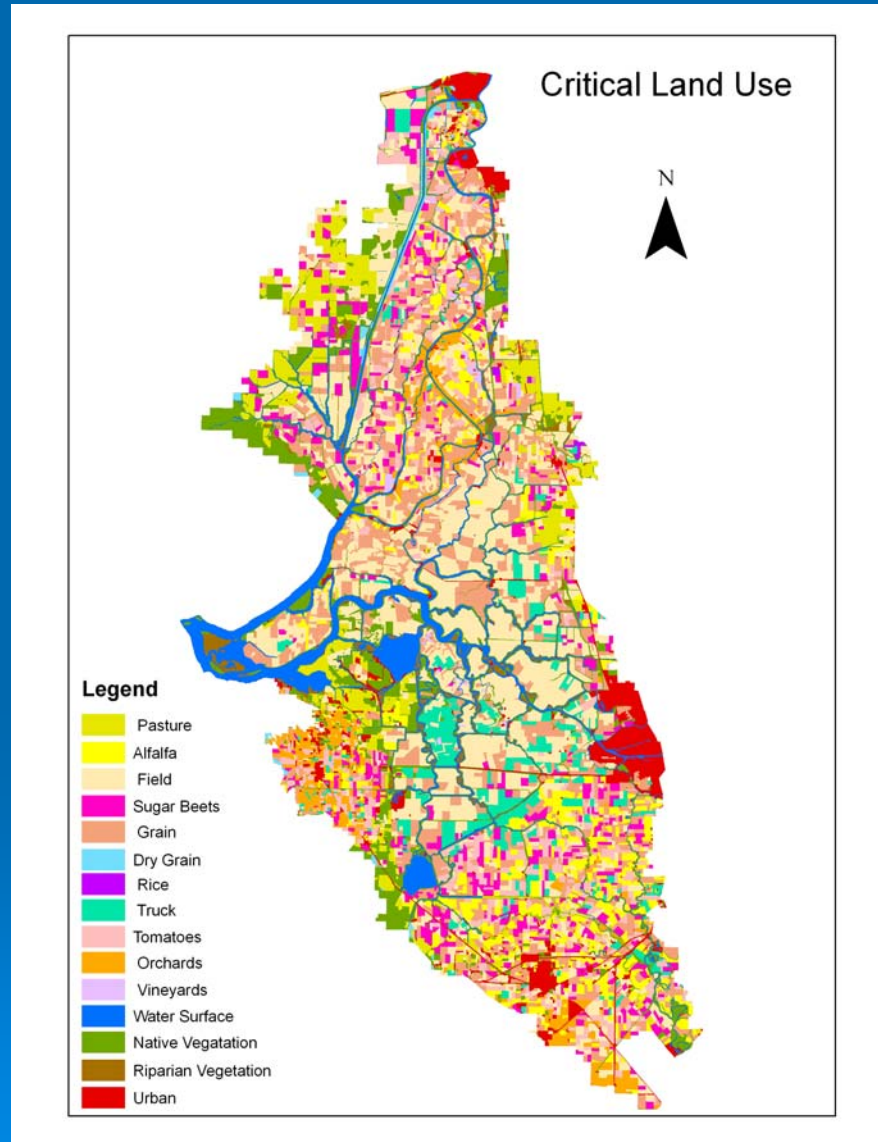

# Correction Factor Isolines (H-S to P-M)

# Non-Critical Year GIS Land Use (1990-2000)

# Critical Year GIS Land Use (1976)

# Delta Uplands Annual Crop Acreages

# Delta Lowlands Annual Crop Acreages

# Crop Codes (DPLA vs Bul-160 vs DICU)

- DPLA vs. Bul-160 vs. C2VSIM
- GIS vs. DICU (DETAW)

# DETA W

*Delta Evapotranspiration of Applied Water*

# DETAW Main Menus

- Update Data Files
  - Weather Data Files
  - Crop/Soil Data Files
- Calculate
  - Historical Soil Water Balance
  - Projected Soil Water Balance
  - Monthly Total Water Balance
  - Historical LL/UL Sum
  - Projected LL/UL Sum
  - Daily Water Balance

# DETAW Main Menus (continued)

- Output Files
  - WRK by SA: daily weather
  - MWD by SA: monthly weather
  - CSV by SA: daily water balance
  - MTV by SA: monthly total of daily water balance
  - EAW by SA: seasonal and annual ETAW by each crop
  - SUM MTV by SA: monthly total water balance
  - MTV by LL: aggregated for lowlands by crop
  - MTV by UL: aggregated for uplands by crop
  - Sum by LL/UL: aggregates all crops
  - AFT by SA: daily water balance

# Input Data Requirements

- Long-term daily maximum and minimum temperature data from Lodi
- Long-term rainfall data from seven locations surrounding the Delta
- Crop & soil information
- Land-use data from October 1921 through September 2003 (WY1922-2003) aggregated by Uplands and Lowlands

# DETAW Output

- Daily  $ET_o$  and rainfall rate data for 168 sub areas
- Daily  $ET_o$ ,  $K_c$ ,  $ET_c$ , and water balance calculations for 15 land-use categories and 168 sub areas.
- Daily, monthly, and annual  $ET_c$ , Net Applied Water, and  $ET_{aw}$  values for 15 land-use categories and 168 sub areas for WY1922 through 2003

# DETAW Output

(continued)

- Monthly  $ET_c$ , Net Applied Water, and  $ET_{aw}$  data by land-use category for the Delta uplands, lowlands, and the entire Delta for WY1922-2003
- Calculated seasonal and annual total of  $ET_c$  and  $ET_{aw}$  for WY1922-2003

# Delta Weather Data

- Long-term daily maximum and minimum temperature data from Lodi
- Long-term precipitation data from seven stations surrounding the Delta

# Crop & Soil Input

- Land-use category
- Start and end dates
- Maximum rooting depth
- Land-use category data were weighted for the proportion of crops and other surfaces within each category (e.g, for  $K_c$  crop coefficients)

# Crop & Soil Input

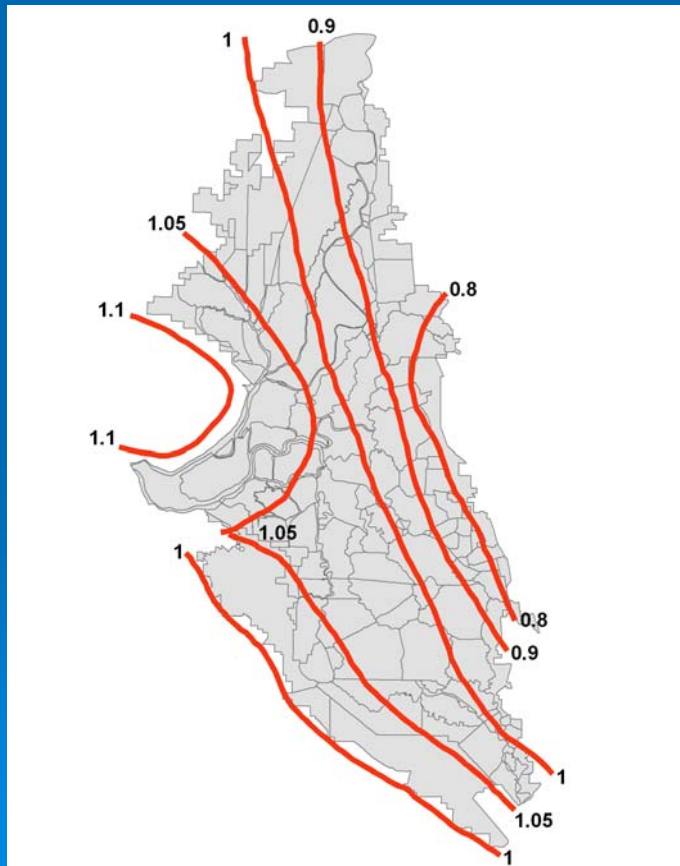

(continued)

- Maximum soil depth = 60 inches
- Available water holding capacity
  - ◆ Lowlands 0.22 in./in.
  - ◆ Uplands 0.16 in./in.
- Allowable depletion (50%)

# Reference Evapotranspiration (ET<sub>o</sub>)

Hargreaves-Samani Equation - Lodi

Using HS estimated ETo from Lodi and Penman-Monteith (PM) ETo estimates from 9 CIMIS stations, isolines of correction factors to estimate PM ETo from Lodi HS ETo were developed. Then GIS was used to estimate correction factors for each sub area within the Delta.

# Crop Coefficients

Off-season (bare soil)  $K_c$

Depends on  $ET_o$  rate and wetting frequency.

# Crop Coefficients

(continued)

Bare-soil evaporation during the off-season is used to estimate initial  $K_c$

# Daily Water Balance

$$\text{Yield Threshold} = \text{Allowable Depletion} \times \text{Plant Available Water}$$

$$\text{Plant Available Water} = \text{Available Water-holding Capacity} \times \text{Effective Rooting Depth}$$

# Daily Water Balance

(continued)

Off-season maximum depletion  
(50% of PAW in upper 30 cm)

$$\text{Soil water Depletion} = \text{Field Capacity} - \text{Soil Water Content}$$

# Daily Water Balance

(continued)

- Effective Seepage
  - if  $S_{pg} > SWD$  then  $E_{spg} = SWD$
  - If  $S_{pg} < SWD$  then  $E_{spg} = S_{pg}$
- Effective rainfall
  - If  $P_{cp} > SWD$  then  $R_e = SWD$
  - If  $P_{cp} < SWD$  then  $R_e = P_{cp}$
- Irrigate when  $(SWD + D_{sw}) > SWD_x$

# $D_{sw}$ and NA

$$D_{sw} = ET_c - E_r - E_{spg}$$

## *Net Application*

- If  $SWD' + D_{sw} > SWD_x$  then  $NA = SWD' + D_{sw}$
- If  $SWD' + D_{sw} < SWD_x$  then  $NA = 0$

$SWD'$  = soil water depletion on the previous day

$SWD_x$  = max allowed soil water depletion

**$ET_{aw}$**

- Daily calculations
- Sum of  $D_{sw} - \Delta SWC$  over season

or

- Sum of NA over season

# A Plot of Cumulative $ET_c$ , $E_r$ , and $E_{spg}$ for Tomatoes in Subarea 1 During Growing Season in 1922

# One-year Water Balance for Tomatoes in 1922 Subarea 1

# Example of Daily Water Balance

- Daily Water Balance

# Extra Features

- Allows one to easily update input weather data files
- Includes a large database of climate data
- Allows easy input of crop and soil information

# DETAW Demonstration

- DETAW mpeg

# Preliminary Results and Comments

- Daily and monthly net application, runoff, etc values for the period WY1922-2003
- Values for both historical and projected levels of land use development
- Verification of numbers under way
- Very I/O intensive (14,000 files and ~15GB storage space)

# Summary

- GIS-based map with 168 subareas in the Delta
  - All areas nested 168→ 142→ Delta UL/LL→ Delta
- DETAW: C++ GUI based on SIMETAW
- Preliminary numbers for daily water balance for each crop for each of the 168 subareas for WY 1922-2003
- Additional work underway to verify numbers and streamline the DETAW I/O requirements
